The 2015 state data sheets contain the most up-to-date Veteran suicide information for all 50 states, the District of Columbia, and Puerto Rico. These sheets reflect the U.S. Department of Veterans Affairs’ expanded analysis of suicide rates and include data that has become available since the release of the 2014 state data sheets.

This Kentucky Veteran Suicide Data Sheet is based on a collaborative effort among the U.S. Department of Veterans Affairs (VA), the U.S. Department of Defense (DoD), and the National Center for Health Statistics (NCHS). The statistics herein are derived from multiple data sources, including the VA Office of Enterprise Integration, the VA Serious Mental Illness Treatment Resource and Evaluation Center, VA Post-Deployment Health Services, the VA Center of Excellence for Suicide Prevention, and the Defense Suicide Prevention Office. Cause of death was identified through the NCHS National Death Index (NDI). For additional information, please email Dr. Megan McCarthy, National Deputy Director for Suicide Prevention, VA Office of Mental Health and Suicide Prevention, at megan.mccarthy@va.gov.

### Kentucky Veteran Suicide Deaths, 2015

</tr>
</tbody>
</table>

Because some of Kentucky’s Veteran populations are relatively small, suicide deaths are presented in ranges rather than precise counts to protect confidentiality.

*Rates calculated from suicide counts lower than 20 are considered unreliable.

After accounting for differences in age, the Veteran suicide rate in Kentucky was significantly higher than the national Veteran suicide rate.

* Rates calculated from suicide counts lower than 20 are considered unreliable.

Data presented herein is based on the U.S. adult population age 18 or older. National and regional statistics presented include the contiguous United States, Alaska, and Hawaii. The total state, regional, and national counts and rates presented are for the general U.S. population, which includes both Veterans and non-Veterans.

Suicide rates presented are the number of suicide deaths in 2015 divided by the estimated population, multiplied by 100,000. Veteran suicide data was obtained from the VA/DoD Joint Suicide Data Repository (SDR), and counts of suicides among the general U.S. population were obtained from CDC Wide-ranging OnLine Data for Epidemiologic Research (WONDER). Veteran suicide rates are calculated using the Veteran Population Projection Model 2016 (VetPop2016) population estimates. General U.S. population rates are calculated using the U.S. Census Bureau American Community Survey (ACS) one-year estimates. Age-specific counts may not sum to the total counts because a small number of deaths with unavailable age information are included in the total counts and rates, but are not included in age-specific counts, age-specific rates, or age-adjusted rates.

Rates are marked with an asterisk (*) when the rate is calculated from fewer than 20 deaths. Rates based on small numbers of deaths are considered unreliable because a small change in the number of deaths might result in a large change in the rate. Because suicide rates based on fewer than 20 suicide deaths are considered statistically unreliable, any comparisons between age-adjusted rates and underlying age-specific rates based on fewer than 20 suicide deaths should also be interpreted with caution. Significance testing is based on the direct age-adjusted rates, using the 2000 standard U.S. population.

Suicide deaths for this data sheet are based on the underlying cause of death listed on the state death certificate as recorded in the SDR. Underlying cause of death, based on the International Classification of Diseases 10th revision (ICD-10), is defined as (a) the disease or injury that initiated the train of events leading directly to death, or (b) the circumstances of the accident or violence that produced the fatal injury.

The ICD-10 codes used to define suicide deaths are X60–X84 and Y87.0.

Methods are based on ICD-10 codes X72 to X74 for firearms, X60 to X69 for poisoning (including intentional overdose), and X70 for suffocation (including strangulation). "Other Suicide" includes all other intentional self-harm, including cut/pierce, drowning, fall, fire/ flame, other land transport, struck by/against, and other specified or unspecified injury. In cases where the number of deaths in any one of the categories was lower than 10, the categories with the smallest numbers were combined until the minimum count of 10 was reached, to maintain confidentiality.

"Other Suicide" refers to all methods of suicide death apart from firearms, suffocation, and poisoning. "Low-Count Methods" refers to methods used in fewer than 10 deaths in a given state or territory. In states or territories with fewer than 10 firearm deaths, suffocation deaths, or poisoning deaths, those data are represented in the "Other and Low-Count Methods" category to protect the privacy of individual suicide decedents.

Veteran Population Model 2016 (VetPop2016), Predictive Analytics and Actuary, Office of Enterprise Integration, Department of Veterans Affairs.  
U.S. general population estimates used for rate calculations are obtained from the U.S. Census Bureau, 2015 American Community Survey one-year estimates.
